

[MOBI.E - E-Mobility Network](#) [1]

Driven by the growing dependence on oil for energy and by the huge environmental impact of the use of fossil fuels, Portugal is investing in new sustainable energy models for mobility that aim to improve quality of life in cities. This has led to the creation of the Electric Mobility Network, an integrated network linking various charging stations in Portugal, which enables electric vehicles to recharge, using a specific charging card.

The main objective of the project is to contribute to a more sustainable mobility model, thus among others also increasing the consumption of electric power produced from renewable energy sources by the electric mobility network. MOBI.E was implemented on a national scale through 25 municipalities that constituted a living lab (called “RENER”) and works as a pilot network supporting the introduction of electric vehicles in Portugal.
